

Magus Labs LLC
Cybersecurity Consulting

PROFESSIONAL CYBERSECURITY SERVICES

About Us

Magus Labs LLC is a Maryland-based software engineering and cybersecurity consulting firm. We specialize in bringing enterprise-grade security assessments to small and medium-sized businesses in the Maryland and Tri-State areas. Our highly experienced consultants provide honest, human-driven analysis to protect your data, your clients, and your reputation.

Services

Baseline Security Audit (\$199)

An essential check for your business's digital footprint. Designed to help meet FTC Safeguards, HIPAA, and general best-practice requirements.

What we do: Instead of relying solely on automated scans, we supplement professional tools with individualized manual assessments of your business' public and internal security posture. We'll inform you of any security gaps we find in any of your systems and applications, draw up a remediation plan, and explain the identified problems and solutions so that you can shore up your digital defenses against attackers.

Business Backup Bundle (\$499)

Baseline Security Audit + Complete peace of mind against Ransomware and data loss.

What we do: In addition to performing an extensive baseline security audit, we provide full, year-round protection against Ransomware attacks. Most recent ransomware attacks target critical services and businesses by encrypting their files and demanding payment. We scan your systems for vulnerabilities and assist you in configuring your digital environment to protect against attacks. As extra insurance, we provide an accessible, properly segmented, and immutable backup.

Pricing and Services Breakdown

Baseline Security Audit (\$199)

External Vulnerability Scan

We use industry-standard tools to map your public-facing network (your website, your IP address, your routers, etc.) to identify open ports, outdated software, or known vulnerabilities that hackers regularly look for

Email & Domain Health Check

We audit your domain's DNS records (SPF, DKIM, DMARC) to ensure cybercriminals cannot spoof or otherwise replicate your email address to scam your clients or vendors

Web Application Testing

We perform checks for misconfigurations, exposed file or directories, and OWASP Top 10 vulnerabilities

Cloud Workspace Review

An optional, high-level review of your Google Workspace or Microsoft 365 tenant (Outlook) to ensure safeguards are enforced and no accidental weak points are hiding in your configurations

Security Findings Report

A plain-English, prioritized Executive Summary detailing exactly what risks were found and step-by-step guided instructions on how you (or your IT provider) can fix them

Business Backup Bundle (\$499)

Everything Included In Baseline Audit

Get the External Vulnerability Scan, Email and Domain Health Check, Web Application Testing, Cloud Workspace Review, and Security Findings Report included in the Baseline Security Audit package.

In-depth Web Application Pentest

A full penetration test against your website(s), complete with actionable findings report.

One (1) Year of Encrypted Files Backup

We set up and configure an accessible, secure data backup solution for all your critical business files. You'll never need to worry about losing access to any of your customer's data or pay a ransom to a hacker.

Vulnerability Remediation

We'll send a qualified technician to walk you through configuration changes, patching, and vulnerability remediation

Year-Round Peace of Mind

We provide a mid-year check-in to verify that your backup architecture is still functioning correctly, provide a free security check-up, and ensure your data remains protected

Why Magus Labs?

- **Human Intelligence:** We are software engineers with experience in cybersecurity. We understand how applications are built, and we understand how attackers might try to break them. We'll perform extensive tests and reviews, then translate any technical flaws and jargon into business risks to add context. Our consultants come from high-speed cybersecurity environments, including the United States Cyber Command and have at a minimum a Master's degree in Cybersecurity.
- **Local & Accessible:** We are your neighbors. You get personalized, local support from a Maryland expert face-to-face or over the phone.
- **No Third-Parties:** We don't try to upsell you on expensive security software or try to lock you into hardware contracts. Our only goal is to give you an honest assessment of your security and recommendations for improving it.

A Note On Artificial Intelligence (AI) In Cybersecurity

In today's world, AI-assisted threats have become increasingly common. Hackers looking to steal your data will assuredly be utilizing AI to increase the speed and effectiveness of their cyberattacks. Because of this, defenders must also look to AI for optimizations in combating such threats. Defenders attempting to combat threats without AI assistance are doing their customers a disservice. To best serve our customers against ALL modern threats, we augment our security reviews with Artificial Intelligence, but do not rely solely on generated discoveries or results. Any AI-assisted information will appear separately in our reports in order to provide transparency and clarity. We always conduct a thorough review of any AI-generated information for accuracy and relevance. You will always receive a human-written and human-reviewed report.
